

For the Lazy Navigator or the Curious Person

Description

From [Celstron](#), the "Sky Scout."

It uses GPS to tell you (computerized voice) what stars/constellations to look for as you point it around. You can also access a menu and select a celestial object/planet and it will guide you to looking at it in the "Locate" mode.

15.2 oz, without batteries, and, I'd certainly be careful about using it in the presence of your enemies, lest they figure out where you are while it tells you what you're looking at.

Hey, at \$399 (plus shipping and applicable sales tax and the cost of some batteries), you can afford to skip your Junior Year NROTC navigation course!
