Iâ€™m Not Sure What to Believe Nowâ€¦

Description

Scientific American for May 2005 says on the cover â€œDo-It-Yourself Black Holes: Physics Gets Ready.â€•Â•

For the loyal blog readers here, youâ€™ll recall that physicists decided a earlier this month that Black Holes didnâ€™t exist. I guess the Scientific American writing staff and editors didnâ€™t get the word. And, for those of you in the military, we know itâ€™s not an excuse when you donâ€™t know, you just get nailed for â€œFailure to get the word.â€• Iâ€™ll admit it, Iâ€™m confused as to whatâ€™s the truth here.

Ok, it looks like if you get out to the garage and dust off your particle accelerator (or head down the community center to use theirs), you know, the one you built as from a Heathkit project, a model of the accelerator at CERN near Geneva, you can possibly make microscopic Black Holes, so you can play in the quantum particle physics field.

default watermark

Donâ€™t worry, these â€œsmallâ€• Black Holes wonâ€™t rip stars apart (they didnâ€™t mention what it will do to the Harley you also keep in the garage).

Once you produce a hole, you should be able to make discoveries to enhance our understanding of the universe. Just make sure you keep your prized Craftsman tools, the golf clubs and your Harley at a safe distance (just in case), to make sure they arenâ€™t taken to a parallel universe.
